

AMENDMENTS TO THE SPECIFICATION

Please replace paragraph 29 of the specification with the following paragraph:

[0029] Preferably the rotation of the touchpad 102 is limited to optimize the haptic cue. A user experiences a haptic cue optimally when the user is unaware of the actual movement of the user interface and instead feels only the cue itself. In one embodiment, a pin 122 ~~(not shown)~~ is attached to the touchpad 102. The pin sits in a slot 124 ~~(not shown)~~ in the button carrier 106. The slot is parallel to the touchpad 102 so that when the touchpad 102 rotates, the pin travels within the slot. In a preferred embodiment, the slot has a length of 2 millimeters. An approximately 2-millimeter stroke is preferred for providing a haptic cue without a user realizing that the touchpad 102 is rotating. This small displacement occurs in response to an actuator and the rotation is felt by the user as a real time haptic cue synchronized with the user interface display events.
